VOL. XIV.

MARCH EDITION.

1919.

Our "Wood's Crop Special" is issued monthly during planting seasons. There is no subscription price, but is mailed free upon request. If any of our customers do not receive Wood's Crop Special regularly, and desire to do so, advise us and we will place your name on our regular mailing list.

SEASONABLE NOTES.

The open winter and early spring this year will enable farmers to get their seeds in early. Take advantage of this opportunity and order your seed early, so you will have them on hand when you are ready to plant. We have good stocks of all Field and Garden Seeds on hand and can make immediate shipment upon receipt of your order.

Plan early—plant early, for best results. Don't delay. Follow closely the "Calendar of Operations" on page 2 of our Catalog. It is a gentle reminder to you of what to plant at the proper season and an important factor is having the seed

on hand in time to plant.

Increase the productiveness of your land by sowing Clover. As well as furnishing a most excellent pasturage and hay for live-stock, it is considered a standard soil-improving crop, adding humus to the soil wherever grown. Even at present prices, we want to impress upon our customers the importance of sowing clover, as there is no other one crop that increases the value of your land, as well as your farm, as clover.

Spring Seeding of Alfalfa

Alfalfa can be sown to advantage in this section, anytime during the months of March and April. Further South, earller seedings are advisable. A satisfactory stand secured from spring seedings will furnish one or two cuttings this year,

and full cuttings next year.

Alfalfa Hay makes the best and most nutritious feed for horses, cattle and all live-stock. After a stand is once established, it will last for years, yielding as much as four or five cuttings a season. To get the very best of results, it is necessary that you secure only the very best American-grown dry land alfalfa seed. Do not be misled by cheap and low grades of alfalfa seed grown on irrigated soil, as these seeds are weak in vitality, and will not make a satisfactory stand.

ALSIKE CLOVER.

Alsike Clover is increasing in demand and popularity every year. Our customers report excellent results from sowing Alsike Clover, not only from sowing by itself, but also in a mixture with Red Clover and Alfalfa. On soils which show any tendency to acidity, we strongly recommend sowing Alsike in preference to Red Clover or Alfalfa, as Alsike is one of the legumes that flourish in acid soil.

The quantity of Alsike required to be sown by itself is 6 lbs., or for heavier seeding 8 lbs. to the acre. When sown in a mixture with Red Clover,, 3 lbs. Alsike, 5 lbs. Red Clover

and 4 lbs. of Alfalfa.

COW PEAS and SOJA BEANS.

We have on hand large stocks of new crop. recleaned Cow or Field Peas and Soja Beans, and are in a position to supply you the coming season to advantage. Early varieties of Cow Peas and Soja Beans for the North and West are our specialty. Write for samples.

CORN FOR SILOS.

Virginia Corns for ensilage, are unsurpassed, and are now being used extensively throughout the North and West. It is a well-known fact that corns grown in Virginia are far superior for ensilage purposes to those grown in other parts of the country. Our customers are continually writing us of the excellent results obtained from growing our corn, which has caused us to biuld up a large trade throughout the Northern States.

For general silage purposes, and early planting we cannot recommend too highly our Wood's Pamunkey or Wood's Virginia Ensilage Corn. Eureka and Cocke's Prolific are also

used very extensively.

For later planting or short season, we would recommend especially the yellow varieties, Improved Golden Dent or Improved Leaming. The yellow varieties, however, do not make as much silage as the tall white varieties mentioned,

and are only recommended for later planting.

We are very careful to test the germination of our corns and all of it is nubbed and selected stock, being thoroughly recleaned before sending out. Order your corn early, so you will have it on hand when weather conditions are favorable for planting. Full information is given on page 84-87 of our Spring Catalog.

The following are some of the letters received about our

Ensilage Corns which will speak for themselves:

The Pamunkey Ensilage Corn received from you, we not only say it is the best that grows around in this section, but the neighbors say the same. We intend to send for some more again.—WM. LYNAGH, Frederick Co., Md.

The Boone County White Corn is grand-15 feet in height, well eared.—EVERT ARCHER, Tyler Co., W. Va.

We have used Wood's Pamunkey Ensilage Corn for silofiling for 3 or 4 years, 1917 well near exclusively. It is leafy, sturdy and ears fairly well in this section, better than other large varieties.—TORBET & DAY, Passaic Co., N. J.

I raised Eureka Ensilage Corn last year for the silo. It did fine. Fourteen acres made 150 tons of fine silage. think it is the corn for the silo .- KERR ROUTZAHN, Montgomery Co., O.

Last year I had 4½ acres of Wood's Virginia Ensilage Corn, and I don't think any other corn would have yielded any more on the same piece of ground. Lots of it was from 14 to 16 feet high. I filled a 11x32 ft. silo which is supposed to hold 61 tons and had a lot left over. This year I had the same piece of ground in and just had enough. We had so much rain that it wasn't half worked. I think, comparing the two seasons, it did better this season than last according to the chance it had.

Virginia Ensilage Corn is very well liked in this section. There are about 25 silos around here. I have filled the most of them and I think at least 8 out of every 10 use the same kind of corn. When you ask them what kind of corn they use they say "Old Virginia." I think it is best. I don't know whether it's best or not, but it is good enough.—HENRY M.

McINTIRE, Cecil Co., Md.

WOOD'S TESTED SEEDS.

The seed cleaning machinery and methods of testing seeds which we use are surpassed by none other in the country. Our forty years' experience in handling seeds of only the very highest quality obtainable, is one of our best assets,

and our large business is due s election seed stocks. test our seeds out to our we know that good germinapurity. Our Brand Seeds

increase in to our careful of superior We always before sending customers, so they are of tion and high Trade Mark are the best

that money can buy, and should not be compared with other seeds of inferior quality being offered. Our customers can always rely on these seeds, not only as being of strong vitality. but free from injurious or objectionable weed seeds.

GRASS SEEDS.

Tall Meadow Oat Grass is rapidly growing in popularity everywhere. It matures to excellent advantage with Orchard Grass, and makes an excellent combination sown with that grass both for hay and pasturage. Sow at the rate of 1 bushel of Orchard Grass, 1 bushel of Tall Meadow Oat Grass to the acre. It is also a good plan to put in about 4 or 5 lb. of Red Clover with this mixture.

Red Top or Herds Grass is one of the best and surest cropping grasses grown. It does better on a larger variety of soils than almost any other grasses, succeeding well on both light and heavy soils, and is adapted both for uplands and lowlands. It is also adapted for sowing with Timothy, as it matures at about the same time. Sow at the rate of 8 to 10 lbs. to the acre alone, or with Timothy, 6 lbs Red Top and 8 bs. Timothy.

WOOD'S SPECIAL GRASS AND CLOVER MIXTURES are put up from grasses in such proportions as experience has shown are best suited to the different soils and purposes for which they are recommended. Those for permanent pasture are composed of grasses which succeed each other in growth and will give a succession from the first of Spring till late in the winter; while for those desired more for cutting hay we have combined grasses which ripen together. The different mixtures are prepared both as to quantity and varieties best adapted to the soils and situations for which they are recommended. We are continually in receipt of letters from our customers speaking of the fine results which they get from our Special Grass Mixtures.

The advantage of sowing grasses and clovers in mixtures has long been recognized and the practice is increasing to a very large extent wherever grasses and clovers are sown. March and April are the best months for spring seeding.

"Pastured All Summer."

The No. 7 Grass Mixture that I bought of you last spring was sown April 1st. It came up fine and I have pastured it all summer and today I have a beautiful pasture. Shall want some next spring.—H. L. REEVES, Dinwiddie Co., Va., Sept.

SPRING VETCH should be sown in March for best result. It makes a quick-growing crop of very nutritiou feed sown with oats at the rate of 25 to 30 lbs. of Vetch with 1 bushel of Spring or Rust-Proof Oats per acre. Spring Vetch also makes a good soil-improver even if the crop is cut off for forage.

CANADA FIELD PEAS.

For an excellent early forage crop, we very strongly recommend the sowing of Canada Field Peas and oats. This combination makes an excellent early nutritious feed and is greatly relished by all kinds of stock. Sow at the rate of one bushel of Canada Field Peas to one-and-a-half bushel of oats, (preferably Burt), and should be sown by the middle of March for best results.

DWARF ESSEX RAPE

Will furnish a nutritious pasturage and green forage crop within 6 to 8 weeks. It makes an excellent green forage crop poultry, and greaty relished by cattle and hogs. For an early grazing crop, we recommend sowing of dwarf Essex Rape liberally, as it is also valuable for soil improvement. be sown as early as the weather will permit at the rate of 6 to 8lbs. broadcast, or 3 to 5 lbs. in drills to the acre.

SEED POTATOES.

Owing to high prices of fertizers and scarcity of labor, truckers are not going to plant potatoes to such a large extent as in previous years. The Southern farmer has put in potatoes very sparingly this year, which will undoubtedly make for a short crop and higher prices this summer and fall. We suggest to our customers to plant potatoes liberally, believing that they will bring good prices when ready to dig. Gardeners should bear this in mind when planning their garden, and not forget this staple crop.

Second Crop Virginia-Grown Potatoes are considered by a good many of our customers to be superior to the Maine-Grown Seed. They are a little smaller in size than the Maine-Grown Potatoes; therefore plant further. They make large yields of uniform potatoes.

Our stocks are grown on the Eastern Shore of Virginia from Maine-grown stocks, and we specially recommend them to our customers.

Our Maine-Grown Potatoes are secured from the most reliable growers in Maine, grown especially for seed purposes, and our customers can always rely on them to be absolutely true to type.

"Maine-Grown Made More and Larger Potatoes."

The Maine-Grown Irish Cobbler Potatoes that I planted this year did well. They made more and larger potatoes than any I ever planted.—D. L. BERRY, Dillon Co., S. C., Sept. 25, 1918.

Culture of Potatoes. In order to have the best success in growing early potatoes, it is best to plant as early in the spring as the ground can be made ready. Potatoes are usually planted in rows three feet apart, and the sets one foot apart in the row. It is always best to plant potatoes on land that has been heavily manured the previous season; or if manure is used at the time of planting, it should be well-rotted and thoroughly mixed with the soil, in order to avoid scab on the potatoes. If the ground is not rich enough, a good application of our Standard Potato Fertilizer should be used. From six to eight hundred pounds is the quantity usually used, although the use of twelve to fifteen hundred pounds to the acre is a very common occurence.

SELECTED SEED OATS.

We wish to call particular atention of our customers to

the Swedish Select and Black Victor Oats, which we offer.

The Swedish Select is one of the best, most satisfactory, and largest-yielding of the White Spring varieties. The quality of grain is far superior to that of other kinds, producing a large, thick, heavy grain, which makes it especially desirable for feeding purposes.

The Black Victor is also a fine, heavy productive type of

the Black Spring Oats. Black oats are usually considered more robust, hardier and heavier yielders than other oats, and this new oat promises to sustain that reputation. The grain is large and contains a remarkably well developed

The Swedish Select and the Black Victor Oats will give better results on a larger variety of soils and under more adverse conditions, than any other varieties on the market, and we believe they are destined to take the lead in both black and white varieties of oats.

Write us for samples and be convinced of the high quality of these varieties over other oats. Prices of oats given on last page of Crop Special.
